compounds, by providing and designing a chemical compound using the model. The method further comprises synthesising the chemical compound, and evaluating the bioactivity of the synthesised chemical compound. The bioactivity is selected from inhibiting binding of a nucleotide donor compound or an acceptor compound to the Murd protein or a membrane. Designing the chemical compounds in which the 3D structure of the compounds are known, and interacting a compound involves directed drug design, and interacting a compound interacting a compound involves directed drug design, random drug design, or grid-based drug design. Designing involves selecting compounds which are predicted to bind to or mimic the 3D structure of the Murd protein. A modulator of glycosyltransferase is useful as antibiotics or antimicrobial agents in animals, and therapeutically or diagnostically in an animal. This is the amino acid sequence of the Bscherichia coli Murd protein crystallised in the

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Eschericia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas acruginosa and Bnterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The be used to screen compounds in rational drug discovery programmes. The nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell priferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent electronic format directly from WIPO at the valoue of the printed specification, but was obtained in electronic format directly from WIPO at the value of the printed specification, but was obtained in electronic format was not an electronic format was not sequences.
                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQ ID NO 10031; 511pp; English.

The present invention describes a purified or isolated nucleic acid sequence (I) consisting essentially of one of the 93 nucleotide sequences of given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and annibiotic activities, and can be used in gene therapy. Expression of (I) in a microorganism inhibits proliferation of the microorganism, and the manufactured antibiotic is useful for reducing the activity or level of a gene product required for proliferation of a microorganism in a subject, specifically humans. The nucleic acids that inhibit bacterial growth or proliferation can be used as antisense therapeutics for killing bacteria. In addition to therapeutic complications, the nucleic acid sequences complementary to sequences required for proliferation can be used as diagnostic tools. For example, nucleic acid sequences complementary to sequences that are specific for particular species of microorganisms can be used as probes to identify particular microorganism species in clinical given in AAG98239 to AAG98431, and AAH814818 to AAH81491 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62 RISGLRGKGIKALIAAPLRIFNAWRQARAIMKAYKPDVVLGMGGYVSGPGGLAAWSLGIP 121

```
the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confirmed for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture compising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent
                                                                       301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid comprising any one of

to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational four discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid comprising any one of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or the activity of an antibody capable of specifically binding the proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that inhibits cellular proliferation; (7) identifying a compound that infinences the activity of the gene product or that has an activity against a biological pathway or required for proliferation or that inhibits proliferation or the biological pathway in which a proliferation required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling cellular proliferation to isolate candidate molecules for rational dentifying proteins or for screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. atracts, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO 
                                                                                                                                       New antisense nucleic acids, useful for identifying proteins or s
for homologous nucleic acids required for cellular proliferation
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                Claim 25; SEQ ID NO 75189; 1766pp; English

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Eschericia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, setuli for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The proteins can be used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The conclete acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic collular proliferation protein. Note: The sequence data for this patent electronic format directly from WHPO at the was obtained in electronic format directly from WHPO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a computation that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)

relates to an isolated nucleic acid comprising

Zyskind JW; Xu HH;

Ohlsen KL, Forsyth RA,

Haselbeck R, Yamamoto R,

Malone C, Carr GJ,

The first sense sequences given in the specification where expression of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide (5) a host cell containing the vector; (3) an isolated polypeptide (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene encivity against a biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than 8, aureus, 8, typhimurlum, The invention relates to an isolated nucleic acid comprising any one of Claim 25; SEQ ID NO 73040; 1766pp; English.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conditions a polypeptide whose expression is inhibited by the antisense concleic acid; (2) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for civity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts, (9) manufacturing an antibiots cellular proliferation of an organism acts, (9) manufacturing an antibiotic; (10) profiling a compound; a culture comprising strains in which the gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts, (9) manufacturing an antibiotic; (10) profiling a compound; a culture comprising strains in which the gene product is oversypressed or underexpressed; (10) profiling a compound; a culture compound that inhibits proliferation of an organism. The antisense mucleic acids required for cellular proliferation in calls other than S. aureus, S. typhumrium, C. dentifying proterans, or for screening homologous nucleic acids required for proliferation in calls other than S. aureus, S. typhumrium, carried for proliferation in calls other than S. aureus, S. typhumrium, call an electronic format directly from NIPO at the rarget prokaryotic essential genes. Note: The sequence is encoded by one of the view in the furty of the present and esquence is encoded by one of the view in the furty of the present directly from NIPO at

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens. Antibodies (Ab) raised against the polypeptides encoded by the genes are used to select compounds that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antiblocies produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and Ab are also useful the resemble to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens and the proteins are as virulence if factors and for identifying targets of human diseases for which P. luminescens is a model for articularly carried and issues of the microbial minimic and minimic productions and for identifying targets of human diseases for which P. luminescens is a model for antibiotic and indications and which P. luminescens is a model for antibiotic and Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides. numinescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins Frangeul L, Claim 2; SEQ ID NO 1964; 1205pp; French Glaser P, WPI; 2003-148459/14. Sequence 356 AA;

New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 68811; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an bost cell containing the vector; (3) an isolated polypeptide (c) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an acitvity against a biological pathway required for proliferation, or that has an acitvity against a biological pathway required for proliferation, or that thabitis cellular proliferation or the biological pathway in which a proliferation-required gene product or that has an acitvity against a biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a pene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is extent compound; a compound; a culture comprising strains in which the gene product is compound; a culture or collection of an extains; or (13) identifying the target of a compound that inhibits the

```
proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids trequired for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at firm wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

the 613 antisense sequences given in the specification where expression of the 131 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has activity against a biological pathway consideration or that the test compound that inhibits proliferation of an organism ctos; (9) manufacturing an antibiotic; (10) profiling a compound; a gene product lies overaxpressed or underexpressed; (10) profiling a compound; a activity; (11) a culture comprising strains; or (13) identifying the texpent in a culture or collection of an organism. The antisense nucleic acids are useful for product is overaxpressed or underexpressed; (12) determining the extent contains or creening for honologous nucleic acids required for proliferation to isolate candidate molecules for rational day discovery programs, or for screening for honologous nucleic acids required for proliferation in cells other than S. aurens, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target proxaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wile specification, but sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  244

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. Zyskind JW; Xu HH;

Claim 25; SEQ ID NO 77456; 1766pp; English.

the 613 antisense sequences given in the specification where expression of 611 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC oncording a polypeptide whose expression is inhibited by the antisense

nucleic acid; (2) a host cell containing the vector; (3) an isolated

collypeptide or its fragment whose expression is inhibited by the

antisense nucleic acid; (4) an antibody capable of specifically binding

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

colliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway

colliferation or that has an activity against a biological pathway

colliferation or that has an activity against a biological pathway

colliferation or the activity of a gene in an operon required for collular proliferation or the biological

contained across the the test compound that inhibits proliferation of an organism acrs; (9) manufacturing an antibiotic; (10) profiling a pathway in which a proliferation-required gene or its gene product lies

compound's activity; (11) a culture comprising strains in which the gene

compound's activity; (11) a culture comprising strains in which the gene

compound's activity; (11) a culture comprising strains in which the gene

compound's activity; (11) a culture comprising strains in which acrossing for which each of the strains is present in a culture or collection of an organism. The antisense mucleic acids are useful for proliferation of an organism. The artisense mucleic acids are useful for dantifying proteins or screening for homologous nucleic acids are useful for dantifying proteins or for screening for homologous nucleic acids required for rearget profileration in cells other than S. aureus, S. typhimuring patent did not form part of the present than S. aureus, S. typhimuring the target pro The invention relates to an isolated nucleic acid comprising any one of

```
proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or the gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts, (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) datermining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the croliferation of an organism. The antisense mucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for callular proliferation to isolate candidate molecules for rational conditions or organism. The present sequence is encoded by one of the proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            62 RISGLRGKGIKALIAAPLRIFNAWRQARAIMKAYKPDVVLGMGGYVSGPGGLAAWSLGIP 121

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, consecutions and Enrerococcus faccalls. The invention is also useful for the identification of potential new targets for antibiotic consecutions used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The protein are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. ```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a prodiferation of a cell. Also included are: CC encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated containing the polypeptide of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular containing the proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a pace in an operon required for proliferation; (8) crequired for proliferation; (7) identifying an activity against a biological pathway in which a proliferation-required gene or the biological containing a gene required for cellular proliferation or the biological containing a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (12) determining the extent compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent contains; or (13) identifying the target of a compound that inhibits the contains; or (13) identifying the target of a compound that inhibits the containing for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferations. The present sequence is encoded by one of the present sequence of the present seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            K. pneumoniae for P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or scre
for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                Protein encoded by Prokaryotic essential gene #16025
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haselbeck R,
Yamamoto R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              claim 25; SEQ ID NO 58422; 1766pp; English

The invention describes a composition comprising a membrane associated UDP-glycosyltransferase, MurG, preferably Escherichia coll protein in crystalline form. A model of UDP-glycosyltransferase is useful in a computer-assisted method of the UDP-glycosyltransferase is useful in a computer-assisted method of structure based drug design of bioactive of compounds, by providing and designing a chemical compound using the method further comprises synthesising the chemical compound, and evaluating the bioactivity of the synthesised chemical compound or an acceptor compound to the MurG protein of a nucleotide donor compound or an acceptor compound to the MurG protein, or inhibiting association of the MurG protein to a membrane. Designing the chemical compounds in which the 3D structure of the compounds are known, and inneracting a compound identified by the screening step with the model by computer. The step of designing involves directed drug design, and inneracting a compound dentified by the screening step with the model by computer. The step of designing involves directed drug design, random drug design, or grid-based drug design, Designing involves selecting compounds which are predicted to bind to or mind the 3D structure of the MurG protein. A modulator of glycosyltransferase is useful as antibiotics or antimicrobial agents in animals, and the heapent coll the Haemophilus influenzae MurG protein which is compared to the heapent of the Haemophilus influenzae MurG protein which is compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the E. coli MurG of the invention

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense rucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide for its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding capable polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; as activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for the dentity and an organism. The antisense nucleic acids are useful and an organism or the recenting conditions and acids are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruqinosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for hot patent did not form part of the parinted specification, but was obtained in electronic format directly from NIPO at firm thub/published_pot_sequences

Zyskind JW; Xu HH;

Ohlsen KL, Forsyth RA,

Claim 25; SEQ ID NO 49098; 1766pp; English.

the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; or that that inhibits cellular proliferation; against exposition pathway in which a proliferation-required fore collular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression

```
organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational cruping discovery programs, or for screening homologous nucleic acids acids acquired for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this partent did not form part of the printed specification, but was obtained in electronic format directly from WIPO a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              126

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                    1881

GENERAL INFORMATION:
APPLICANT: GARY ERETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABILL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION WUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
                                                                                                                                                                                                                                                                                               APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCEEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCEEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILER REFERENCE: 2709.204001

Sequence 26203, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc U. Rubenfield et al.
ATTLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPREBACE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PLING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PLING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/094,190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          123 VLHEQNGIAGLINKWLARIATKVMQAEPGAFP-NAEVVGNPVRIDVLALPLPQQRLAGRE 181
